- 1. A clamping mechanism for clamping at least two structural components to each other comprising a clamping bail forming a clamping opening, a first clamping section (9) carried by said clamping bail to face across said clamping opening, a second clamping section (10) carried by said clamping bail to face across said clamping opening in alignment with said first clamping section (9), said first clamping section comprising a guide element (11) for guiding a drill bit, a removable centering pin (12) axially movable in said quide element (11) for aiding in positioning a first structural component of said at least two structural components in a correct drilling position, and wherein said second clamping section (10) comprises a pressure member (15) and a clamping drive for pressing said pressure member against a second structural component of said at least two structural components and against said first structural component to establish a clamped position for said at least two structural components.
 - 2. The clamping mechanism of claim 1, wherein said guide element (11) is constructed as a drill bushing for first guiding said centering pin (12) and for then guiding said drill bit (DB) after removal of said centering pin (12) from said drill bushing (11).

- The clamping mechanism of claim 1, further comprising an adapter (20) secured to said first clamping section (9) in axial alignment with said guide element for holding a drill in an aligned drilling position.
- The clamping mechanism of claim 3, wherein said adapter (20) comprises a locking device for locking said drill to said first clamping section (9).
- 5. The clamping mechanism of claim 3, wherein said adapter (20) is a chuck for locking said drill to said first clamping section (9).
- The clamping mechanism of claim 1, wherein said clamping drive comprises a cam (13A), an eccentric mounting (14) rotatably securing said cam (13A) to said second clamping section (10) and a drive lever (13) secured to said cam for rotating said cam against said pressure member (15).
- 7. The clamping mechanism of claim 1, wherein said clamping drive comprises a clamping screw (21) rotatably mounted in said second clamping section, said clamping screw having a free end forming said pressure member (15).
- The clamping mechanism of claim 1, wherein said clamping drive comprises a clamping push rod (22) slidably and rotatably mounted in said second clamping section and an operating lever (23) secured to one end of said clamping

- push rod, said clamping push rod having a free end forming said pressure member (15).
- The clamping mechanism of claim 1, wherein said clamping drive comprises a piston cylinder device mounted to said second clamping section, said piston cylinder device comprising a piston having a free end forming said pressure member (15).
- 1 10. The clamping mechanism of claim 1, further comprising a suction device (17) communicating with said guide element (11) for sucking drill chips out of said guide element.
- 1 11. The clamping mechanism of claim 1, wherein said guide
 2 element (11) comprises a hollow guide channel in said first
 3 clamping section (9), said hollow guide channel being
 4 axially aligned with said pressure member (15) in said
 5 second clamping section.
 - 12. The clamping mechanism of claim 1, wherein said pressure member (15) comprises a free end for contacting said other structural component and a dead end bore or cavity (15A) in said pressure member in axial alignment with said guide element (11), said dead end bore opening into said free end of the pressure member wherein said free end of the pressure member, in a clamping position surrounds a structural component area through which a hole is being
